

Funny Modular Sequence

Lets define a funny modular sequence as a sequence such that $a_1 \times a_2 = 1 \pmod{p}$, $a_2 \times a_3 = 1 \pmod{p}$..., $a_{n-1} \times a_n = 1 \pmod{p}$. Also, $a_1, a_2, a_3, \dots, a_n$ must be less than p and greater than or equal to 0. Given one element, a_1 , find the sum of the entire funny modular sequence of length n . If, for any a_i , where $i \geq 1$, there exists no a_{i+1} such that $a_i \times a_{i+1} = 1 \pmod{p}$, output -1.

Note: p is not necessarily prime.

Input:

The first line contains T , the number of test cases.

T lines follow, each containing a_1, p , and n .

Output:

For each test case, output one line, the required sum.

Constraints:

$$1 \leq T \leq 10^5$$

$$1 \leq a_1 \leq 10^5$$

$$1 \leq n \leq 10^9$$

$$a_1 < p \leq 10^9$$

Sample Input:

2

2 3 2

3 7 2

Sample Output:

4

8

Explanation

In the first test case, the funny modular sequence will be 2, 2, which has a sum of 4.

In the second test case, it will be 3, 5, which has a sum of 8.
